                                                                                                                      Gene product has inhibitory activity against human leukocyte elastase (HLE) and may be isolated from psoriatic scales. The sequence may be expressed from a plasmid transformed expression system and may be useful in the prevention of tissue damage associated with emphysema, adult respiratory distress syndrome, psoriasis and bullous dermatoses. Other treatable conditions include atherosclerosis, cystic fibrosis, bronchitis and acute non-lymphoblastic leukaemia.
                             Human leucocyte elastase inhibitor - is genetically engineered polypeptide for treatment of inflammatory, pulmonary and skin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      150 Arcaaaagrecrereaagerrecrecegrarescriverrecata 200

The present invention relates to a number of nucleic acid sequences which encode proteins associated with head, neck and lung tumours. These tumours are often not diagnosed until they have spread, and, of those who survive, most must endure alterations in facial and neck appearance as well as changes in speech, sight, smell, chewing, swallowing and taste be used in the diagnosis, treatment and vaccination against cancer, particularly papillary and follicular carcinomas, papillary tumours, follicular adenoma, parathyroid hyperplasia, parotid cancer, lip cancer, equamques call cancer of the tongue, oral tongue cancers and larynx
such as head, neck and lung cancer
                                            Claim 3; Page 71; 77pp; English.

The invention relates to polynucleotides encoding colon tumour proteins. The polynucleotides and encoded polypeptides are useful in pharmaceutical compositions, such as vaccines, for the diagnosis, prevention, and treatment of colon cancer. Polynucleotide sequences may be used as hybridisation probes or primers, and in the design and preparation of ribozyme molecules for inhibiting expression of tumour polypeptides and proteins in tumour cells. The compositions are useful for stimulating an immune response against cancer, particularly for the immunotherapy of colon cancer, and as markers for the progression of cancer. ABK4450-ARK4621 represent coding sequences of human colon tumour
                                                                                                                                                                                                                        proteins of the invention.

Note: With the exception of SEQ ID No 1 and 2, the sequence data for this patent did not form part of the printed specification but was supplied by the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       369 GCGCAGAGCCAGTCAAAGGTCCAGINTCCACTAAGCCTGGCTCCTGCCCCATTATCTTG 310

                                                                                                                                                                                                                                                                                                       Gene product has inhibitory activity against human leukocyte elastase (HLE) and may be isolated from psoriatic scales. The sequence may be expressed from a plasmid transformed expression system and may be useful in the prevention of tissue damage associated with emphysema, adult respiratory distress syndrome, psoriasis and bullous dermatoses. Other treatable conditions include atherosclerosis, cystic fibrosis, bronchitis and acute non-lymphoblastic leukaemia.

Abs raised to the polypeptide may be used in detection.
                                                                                                                                                                                                            Human leucocyte elastase inhibitor - is genetically engineered

ABQ56306 to ABQ60787 represent isolated nucleic acids (I) differentially expressed in cancer tissues. ABB78993 to ABB79004 represent proteins encoded by the ABQ6078 to ABQ60787 uncleic acid sequences. (I) can be used in antisense therapy. An antibody immunoreactive with a polypeptide encoded by (I) is useful for detecting cancer in a patient sample, and for detecting the presence or absence of a polynucleotide encoded by a nucleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the presence of a nucleic acid which hybridises to (I), and for determining the phenotype of cells in a sample of class from a patient. (I) is useful for determining the presence of colon cancer in a cell or tissue type, for determining the presence of state of other type of cancer, in antisense therapy, to generate macroarrays on a soild surface, to identify a chromosome on which the corresponding gene resides, and in tissue profiling, forensics, genetic analysis, mapping and diagnostic applications. (I) can be used to raise antibodies, and to screen for peptide analogues and antagonists.
                                                                                                                                                                                                             New isolated nucleic acid that is differentially expressed in cancer tissues useful for determining the presence of colon cancer in a cell or tissue type, and in antisense therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              210 gegenagadecendrenanagerecentrecentrangeceregerecendecentrateria 269

The invention relates to detecting (MI) granulocyte (GC) activation CC (GCA), by detecting the level of expression of gene(s) (GS) identified by DNA chips analysis as given in the specification, and comparing the expression level to an expression of GS is indicative of GCA.

Also included are modulating (M2) GA by contacting GC with an agent capable of modulating GA by contacting GC with an agent capable of modulating GCA or an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the level of expression of the gane is indicative of inflammation, the analysic response in a subject, exposure of a subject to a pathogen or sterile inflammation of especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject response in a subject, exposure of a subject to a pathogen or sterile inflammation with an agent that modulates the expression of gene(s) from GS in the tissue. M1 is useful for considering dA; M3 is useful for screening an agent capable of modulating GA; M3 is useful for screening an agent capable of modulating GA; M3 is useful for screening an agent capable of subject to a pathogen or sterile inflammation dispectally chronic) in a tissue, an allergic ersponse in a subject, exposure of a subject to a pathogen or sterile inflammation disease (e.g. psoriasis; rheumatory disease (e.g. psoriasis; rheumatory disease; also bacterial infection, viral infection, and infection, to prince or perfection, procozal infection, disease, ulcerating one of the above conditions. The present confidence represents a gene differentially expressed in granulocytes.

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene given in ABLG1664 to ABLF0110), or is at least 95% identical to (S), where a change in comprises a sequence (S) selected from 847 sequences (given in ABLG1664 to ABLF0110), or is at least 95% identical to (S), where a change in activity and can be used in gene therapy. MI can be used for screening a nati-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the scrutture and/or properties of the agent. MI can be used in the structure and/or properties of the agent. MI can be used in the creatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating ductal cancer, confiltrating and cancer  adamened cancer, infiltrating ductal cancer, infiltrating ductal cancer, infiltrating ductal cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1554 GCGCAAGAGCCAGTCAAAGGTCCACTAAAGCCTGGCTCCTGCCCCATTATCTTG 1613
                                                                                                                                                                                                                                                                                                                             Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          21 IleArgCysAlaMetLeuAsnProProAsnArgCysLeuLysAspThrAspCysProGly 40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ŝ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Carter KC, Ebner R, Endress G, Horrigan

```
to ABL70110), or is at least 95% identical to (5), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a structure and/or properties of the agent. MI can be used in the reatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine

The present sequence represents a pPIC9/ELF25L cDNA construct containing the diafin 25L gene, used in an example of the present invention. The present invention describes: (1) an elafin (EL) expression vector comprising a gene encoding EL and a gene encoding alcohol oxidase 1 controlling region (AOCR) which controls the expression of EL encoding gene; (2) a microbial host transformed with the vector; (3) DNA fragment for recombinant transformation comprising: (a) a first region homologous to the genomic DNA of the host; (b) a promoter region of (AOCR) gene; (c) a gene encoding signal peptide; (d) a linker designed to secrete a matured elafin; (e) a gene encoding EL; (f) selection marker gene; (g) stop codon, and (h) a second region homologous to a part of the genomic DNA of the host, and (4) a microbial host can be used to prepare EL commercially. The production of EL by the microbial hosts can be carried
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1204 GCTCAAGAACCAGTTAAGGGTCCGGTGTCGACCAAACCGGGCTCTTGCCCGATTATCCTG 1263

The DN encoding wild type elafin is mutated, inserted into a sustable vector and then used to transform E. coli, yeast, Bacillus subtilis or animal cells. The modified elafin is expressed when the transformed cells are cultured. The modified elafin are drugs with elastase inhibitor activity. They have improved oxidation stability over natural elafin and thus retain activity better under oxidative

In this procedure, a single strand phagemid cDNA library from normal cell polyA+ mRNA is hybridized with excess biotinylated tumor polyA+ mRNA, and the resulting double stranded sequences are removed by binding to streptavidin. The remaining single-stranded phagemid cDNAs are converted to double-stranded form and used to transform bacterial host cells. The resulting subtracted cDNA library is differentially

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SPAI; sodium ion, potassium ion, ATP-ase inhibitor peptide; cardiac; vascular disease; PCR; polymerase chain reaction; ss.
            produced some 20 additional cloned cDNAs. Also found by this method were several genes which, on the basis of the partial DNA sequences appear to be novel sequences not previously entered into GENBANK. The portion of the cDNAs so sequenced represents part of the coding region and/or part of the 3' untranslated region of each cDNA (see Q28749-58).
                                                                                                                                                                                                                                                                                        1 AlaGlnGluProValLysGlyProValSerThrLysProGlySerCysProllelleLeu
                                                                                                                                                                                                                                                                                                           144 GCGCAAGAGCCAGTCAAAGGTCCAGTCTCCACTAAGCCTGGCCCCGCTGCCCCATTATCTTG

Determining difference between expression levels of genes characteristic of rheumatoid arthritis in cell and reference level, by comparing expression levels of the genes determined in a cell with reference level

Example 3; Page 88; 296pp; English.

The present invention describes a method (M1) for determining the difference between levels of expression of a number of genes characteristic of rheumatoid arthritis (RA) in cell and reference levels of expression of the genes, computising: (a) providing RNA from a cell; of expression of the genes, computising: (a) providing RNA from a cell; of RA including a number of genes selected from SOCS3 (CISH3), RAGE (AGER), LST-1 (LY117), serum amyloid (SAA) 1-3, hydroxymethyl glutarate (HMG)-1, SIO AB, A9, and A12, secretory leukocyte protease inhibitor (SILPI), glucocorticoid leucine zipper (GIZI), PTPN-18, GADD-45A and B, Legumain (PRSC1), follistatin-like 1 (FST1), lipocalin 2 (Lon2), glucose phosphate isomerase (GFI), serine protease inhibitor (SpiL), and TSG-6 (c) comparing the levels of expression of the genes in the cell to a set of reference levels of expression of the genes, to determine the clifference between levels of expression of the genes, to determine the difference between levels of expression of the number of genes characteristic of RA in the cell and reference levels of expression of the number of genes in the cell in the cell and reference levels of expression of the sories of the genes. likely to develop RA, or for determining whether a therapy for RA is effective in a subject having RA who is receiving the therapy. MI is also useful for determining the stage of RA in a subject, for determining the efficacy of a therapy in a subject having RA, and for determining the likelihood of success of a particular therapy in subject having RA. The present sequence represents a murine SLPI antisense riboprobe, which is used in an example from the present invention.

```

The present invention provides gene sequences associated with cancer metastasis which are isolated from mouse IMC carcinoma cells by detection of their higher expression in IMC-HM cell lines than in IMC-LM cell lines using differential display of the mRNA in these cells. The gene sequences can be used for the screening of potential inhibitors of cancer metastasis by either: bringing into contact with the cancer metastasis associated protein (CMAP) and determining the degree of binding; or creating a transformant cell line which expresses CMAP and measuring the degree of expression of CMAP using an antibody recognising the protein, either in the presence or absence of the potential inhibitor. IMC-HM cells transformed with antisense CMAP DNA show a lowered ability to metastasise. The present sequence represents a specifically claimed gene sequence from the present invention. The present invention provides gene sequences associated with cancer metastasis which are isolated from mouse IMC carcinoma cells by detection of their higher expression in IMC-HM cell lines than in IMC-HM cell lines than in IMC-HM cell lines using differential display of the mRNA in these cells. The gene sequences can be used for the screening of potential inhibitors of cancer metastasis by either: bringing into contact with the cancer metastasis by either: bringing into contact with the cancer binding; or creating a transformant cell line which expresses CMAP and masuring the degree of expression of CMAP using an antibody recognising the protein, either in the presence or absence of the potential thinbiblox. IMC-HM cells transformed with antisense CMAP DNA show a lowered ability to metastasise. The present sequence represents a specifically claimed gene sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   685 CCCATTCGCAAACCAGTGTGGAGGAAGCCTGGGAGGTGCGTCAAAACTCAGGCAAGATGT 744

Thompson RC; Stetler GL, Bandyopadhyay PK, Eisenberg SP, WPI; 2000-678667/66. New serine protease inhibitors and DNA sequences for treating a protease-mediated condition or tissue destruction e.g. emphysema or tumor invasion and for recombinant production of inhibitors

Claim 22; Column 61-62; 47pp; English.

ABS3098 - AABS3122 represent the protease inhibitors. Peptide sequences AABS3098 - AABS3122 represent the protease inhibitor of the invention and various other peptides used in the isolation of the protease inhibitors. The protease inhibitors have cytostatic and anti-inflammatory activity. The serine protease inhibitor protein is useful for treating a protease—mediated condition, which includes protease mediated tissue destruction, e.g. emphysema, arthritis, glomerulonephritis, pursular dystrophy or tumour invasion. It is also useful for modulating protease activity. The DNAs are useful for producing the This invention relates to new purified and isolated mammalian serine protease inhibitor proteins which comprise at least 8 cysteine residues and no more than 107 amino acids. The protease inhibitors are capable of inhibiting chymotrypsin and elastase. Sequences AAC97526 - AAC97534, AAC97574 - AAC97581 and AAC97614 - AAC97641 represent DNA encoding the protease inhibitors of the invention, and include oligonucleotide sequences used in the isolation and characterisation of the proteins. Primers AAC97515 - AAC97573 and AAC95582 - AAC97613 are used in the proteins, especially by recombinant methods.

WPI; 1999-166640/14. P-PSDB; AAW94481. New DNA sequence encoding mammalian serine protease inhibitor useful for recombinantly producing inhibitors with different specificities and treating diseases such as emphysema, arthritis, muscular dystrophy, and tumour invasion

Example 9; Column 43; 37pp; English.

The present invention describes a DNA sequence (A) encoding an analogue of a mammalian serine protease inhibitor (B). The DNA sequences and recombinant methods allow manufacture of a class of inhibitors of e.g. cathepsin G, elastase, and trypsin, with different specificities. The recombinant serine protease product can be directed to act intracellularly or extracellularly and is useful in treating conditions caused by a disturbance in the native protease/protease inhibitor balance such as emphysema, arthritis, glomerulonephritis, peridontitis, muscular dystrophy, tumour invasion, sepsis, and acute leukemia. (A) caused by a compinantly produced in sufficient quantities and purities so as to provide economical pharmaceutical compositions. (B) is resistant to heat, acid, and a variety of proteolytic enzymes, is thermodynamically stable in extracellular conditions, and exhibits a high degree of self assembly forming an active tertiary structure in the absence of biochemical stimuli. The present sequence encodes a secretory conditions and exhibits a become of biochemical stimuli. The present sequence encodes a secretory conditions and secretory conditions.

```
The invention relates to a DNA sequence encoding an analog of a mammalian serine protease inhibitor protein. The analog comprises at least eight cysteine residues and possesses serine protease inhibitor activity, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New DNA sequences, useful in recombinant DNA techniques for directing the production of a serine protease inhibitor protein, e.g. leukocyte elastase or trypsin
                                                                                                                                                                                                       3 GluProValLysGlyProValSerThr----LysProGlySerCysProllelleLeu 20

Elastase inhibitor; human polymorphonuclear leukocyte elastase inhibiting
at least one operational element consisting of a promoter, an operator, a least sequence, a Shine-Dalgarno sequence, a riboscome binding site or a terminator codon. The DNA is useful in recombinant DNA techniques for directing the production of a serine protease inhibitor protein, e.g. leukcoyte elastase or trypsin. The present sequence represents the cDNA emncoding a secretory leukcoyte protease inhibitor (SLPI) analogue that has chymotrypsin and elastase inhibitory activity.
                                                                                                                                                                                                                                                                                                                       3 GluproValLysGlyProValSerThr----LysProGlySerCysProllelleLeu 20

This invention relates to a novel fusion protein comprising a first protease inhibitor comprising an alphal-antitrypsin or its functionally active portion and a second protease inhibitor or its functionally active portein. The fusion proteins of the invention may act as an inhibitor of protease activity. The fusion protein of the invention of the invention is useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, chronic obstructive pulmonary disease, cystic fibrosis, otitis media, officis exermal or HIV infection, or for treating an individual suffering from or at risk for a disease or disorder involving unwanted protease activity. The proteins are useful cor treating dermatological diseases such as atopic dermaticis, eczema and psoriasis, in inflammatory responses to viral infection, and for treating dermatological diseases such as atopic dermaticis, creaming connection, sepsis, rheumatoid arthritis, periodonial disease, tumour metascasis and tumour anglogenesis, gastric ulceration, chronic osteoporosis, Paget's disease, glomerulonephritis, scleroderma, malaria, bacterial infection, Alzheimer's disease, hypertension and muscular dystrophy. The present sequence represents the DNA encoding the human secretory leukoprotease inhibitor used to create the fusion protein
                                                                                                                                                                                                                     Novel fusion protein useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, comprises a first protease inhibitor comprising alpha 1-antitrypsin and a second protease inhibitor -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         205 GGTCAATGTTTGATGTTGAACCCACCAACTTCTGTGAAATGGACGGTCAATGTAAGAGA 264

of a mammalian serine protease inhibitor (B). The DNA sequences and recombinant methods allow manufacture of a class of inhibitors of e.g. catheppin G, elastase, and trypsin, with different specificities. The recombinant serine protease product can be directed to act intracellularly or extracellularly and is useful in treating conditions caused by a disturbance in the native protease/protease inhibitor balance such as emphysema, arthritis, glomerulonephritis, peridontitis, muscular dystrophy, tumour invasion, sepsis, and acute leukemia. (A) culties so as to provide economical pharmaceutical compositions. (B) is resistant to hear, acid, and a variety of proteolytic enzymes, is chermodynamically stable in extracellular conditions, and exhibits a high degree of self assembly forming an active tertiary structure in the absence of biochemical stimuli. The present sequence represents a DNA
                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a DNA sequence (A) encoding an analogue

The present invention describes a DNA sequence (A) encoding an analogue of a mammalian serine protease inhibitor (B). The DNA sequences and recombinant methods allow manufacture of a class of inhibitors of e.g. cathepsin G, elastase, and trypsin, with different specificities. The recombinant serine protease product can be directed to act intracellularly or extracellularly and is useful in treating conditions caused by a disturbance in the native protease/protease inhibitor balance such as emphysema, arthitis, glomerulonephritis, peridontitis, muscular dystrophy, tumour invasion, sepsis, and acute leukemia. (A) allows (B) to be recombinantly produced in sufficient quantities and purities so as to provide economical pharmaceutical compositions. (B) is resistant to heat, acid, and a variety of proteolytic enzymes, is thermodynamically tabble in extracellular conditions, and exhibits a thingh degree of self assembly forming an active tertiary structure in the absence of biochemical stimuli. The present sequence represents a DNA cabbeauch and surfacellular conditions.
                                 Serine protease inhibitor; human; emphysema; arthritis; peridontitis; muscular dystrophy; tumour invasion; glomerulonephritis; sepsis;
Serine protease inhibitor direct manufacturing DNA sequence (SLPI).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     useful for recombinantly producing inhibitors with different specificities and treating diseases such as emphysema, arthritis,

This invention relates to new purified and isolated mammalian serine protease inhibitor proteins which comprise at least 8 cysteine residues and no more than 107 amino acids. The protease inhibitors are capable of inhibiting chymotrypsin and elastase. Sequences AAC97526 - AAC97531, AAC97531 and AAC97614 - AAC97641 represent DNA encoding the protease inhibitors of the invention, and include oligonaclectide sequences used in the isolation and characterisation of the proteins. Primers AAC97535 - AAC97573 and AAC95828 - AAC97613 are used in the construction of DNA encoding the protease inhibitors. Peptide sequences AAB53098 - AAB53122 represent the protease inhibitors of the invention and represent so the resolution and anti-inflammatory activity. The serine protease inhibitors protein is useful for treating a protease inhibitor protein is useful for treating a destruction, e.g. emphysema, arthritis, glomerulonephritis, puscular dystrophy or tumour invasion. It is also useful for modulating protease activity. The DNAs are useful for producing the conteins, especially by recombinant methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Serine protease inhibitor; cytostatic; anti-inflammatory; arthritis; protease mediated tissue destruction; emphysema; glomerulonephritis; periodontitis; muscular dystrophy; tumour invasion; chymotrypsin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New serine protease inhibitors and DNA sequences for treating a protease-mediated condition or tissue destruction e.g. emphysema or tumor invasion and for recombinant production of inhibitors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Thompson RC;
                                                                                                                                                                                                                                                                                                                                                                                                                           DNA encoding a serine protease inhibitor peptide sequence.

This invention relates to new purified and isolated mammalian serine protease inhibitor proteins which comprise at least 8 cysteine residues and no more than 107 amino acids. The protease inhibitors are capable of inhibiting chymotrypsin and elastase. Sequences AAC97526 - AAC97534, AAC97574 - AAC97581 and AAC97614 - AAC97641 represent DNA encoding the protease inhibitors of the invention, and include oligonucleotide sequences used in the isolation and characterisation of the proteins. Primers AAC97535 - AAC97573 and AAC95582 - AAC97613 are used in the construction of DNA encoding the protease inhibitors. Peptide sequences AAB5302 represent the protease inhibitors of the invention and various other peptides used in the isolation of the protease inhibitors have cytostatic and anti-inflammatory activity. The serine protease inhibitors protein is useful for treating a protease-mediated condition, which includes protease mediated tissue destruction, e.g. emphysema, arthritis, glomerulonephritis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAC97579
```

a

ò g ઠે g ò This invention relates to new purified and isolated mammalian serine protease inhibitor proteins which comprise at least 8 cysteine residues and no more than 107 amino acids. The protease inhibitors are capable of

```
inhibiting chymotrypsin and elastase. Sequences AAC97526 - AAC97534,

AAC97574 - AAC97581 and AAC97614 - AAC97641 represent DNA encoding the protease inhibitors of the invention, and include oligonucleotide sequences used in the isolation and characterisation of the proteins. Primers AAC97535 - AAC97573 and AAC95582 - AAC97613 are used in the construction of DNA encoding the protease inhibitors. Peptide sequences CAAB53089 - AAB53122 represent the protease inhibitor of the invention and various other peptides used in the isolation of the protease inhibitors have cytostatic and anti-inflammatory activity. The serine protease inhibitors protease inhibitors protease inhibitors protease inhibitors have cytostatic and anti-inflammatory activity. The serine protease inhibitors protein is useful for treating a destruction, e.g. emphysema, arthritis, glomerulonephritis, periodontitis, muscular dystrophy or tumour invasion. It is also useful contains and andulating protease activity. The DNAs are useful for producing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   145 GATCCGGTTGATACCCCGAACCCGACTCGAAAACCGGGTAAATGCCCGGTAACCTAT 204

```
The invention relates to a DNA sequence encoding an analog of a mammalian escribe protease inhibitor protein. The analog comprises at least eight cysteine residues and possesses serihe protease inhibitor activity, and at least one operational element consisting of a promoter, an operator, or a terminator codon. The DNA is useful in recombinant DNA techniques for directing the production of a serine protease inhibitor protein, e.g. leukocyte elastase or trypsin. The present sequence represents the coding strand of a DNA that directs the manufacture of a recombinant

The invention relates to a DNA sequence encoding an analog of a mammalian exrine protease inhibitor protein. The analog comprises at least eight cysteine residues and possesses serine protease inhibitor activity, and at least one operational element consisting of a promoter, an operator, a leader sequence, a Shine-Dalgarno sequence, a ribosome binding site or a terminator codon. The DNA is useful in recombinant DNA techniques for directing the production of a serine protease inhibitor protein, e.g. leukocyte elastase or trypsin. The present sequence represents the coding strand of a DNA that directs the manufacture of a recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ovarian tumour marker gene; human; overexpression; upregulation; idepthelial tumour; cancer; diagnosis; prognosis; disease monitoring; identification; serous cystadenoma; borderline serous tumour; serous cystadenocarcinoma; mucinous cystadenocarcinoma; mucinous cystadenocarcinoma; mucinous cystadenocarcinoma; organical mucinous tumour; endometrioid carcinoma; undifferentiated carcinoma; clear cell adenocarcinoma; cystadenofibroma; adenofibroma; Brenner tumour; serial analysis of gene expression; SAGE; membrane localised; secreted; therapeutic target; cytostatic;

Detecting and identifying ovarian tumor, identifying increased risk for developing ovarian cancer, and determining effectiveness of ovarian cancer treatment, by measuring expression level of ovarian tumor marker dene

Claim 23; Page 98; 140pp; English.

The invention relates to methods for diagnosing and prognosing ovarian tumours in an individual via the detection and measurement of the expression of ovarian tumour marker genes (ABA81081-ABA81182, ABA81180, ABA81181 and ABA81181). The methods of the invention are useful for detecting an ovarian tumour in a patient, for identifying an individual at increased risk for developing ovarian cancer, in prognostic tests for assessing the relative severity of ovarian cancer, in tests for monitoring a patient in remission from ovarian cancer. The methods can additionally be used to identify a particular tumour as being an ovarian tumour (i.e., an epithelial ovarian tumour selected from serous cystadenoma, borderline serous tumour, serous cystadenocarcinoma, borderline mucinous tumour, mucinous cystadenocarcinoma, endometriol carcinoma, undifferentiated carcinoma, clear cell adenocarcinoma, endometriol carcinoma, adenofibroma and Brenner cumour The ovarian tumour marker genes of the invention were identified using SAGE (serial analysis of gene expression) and were found to be overexpressed in a broad variety of ovarian epithelial tumour cells relative to normal ovarian folding, and many of these are membrane proliferation and in protein folding, and many of these are membrane potalised or secreted. In addition to their use as diagnostic and content of the diagnostic and content of their use as diagnostic and content of the diagnostic and content of their and content prognostic markers, the ovarian tumour marker genes or their encoded proteins may be used as therapeutic targets for the treatment and orevention of ovarian cancer. Sequences ABA83081-ABA83122, ABA83180, ABA83182 and ABA83184 represent the ovarian tumour marker genes of the invention

New DNA sequence encoding mammalian serine protease inhibitor - useful for recombinantly producing inhibitors with different specificities and treating diseases such as emphysema, arthritis, muscular dystrophy, and tumour invasion

Example 3; Column 37-40; 37pp; English.

(B) is thermodynamically stable in extracellular conditions, and exhibits a high degree of self assembly forming an active tertiary structure in the absence of biochemical stimuli. The present sequence represents the DNA The present invention describes a DNA sequence (A) encoding an analogue of a mammalian serine protease inhibitor (B). The DNA sequences and recombinant methods allow manufacture of a class of inhibitors of e.g. cathepsin G, elastase, and trypsin, with different specificities. The recombinant serine protease product can be directed to act intracellularly or extracellularly and is useful in treating conditions caused by a disturbance in the mative protease/protease inhibitor balance such as emphysema, arthritis, glomerulonephritis, peridonitis, muscular dystrophy, tumour invasion, sepsis, and acute leukemia. (A) allows (B) to be recombinantly produced in sufficient quantities and purities so as to provide economical pharmaceutical compositions. (B) is resistant to heat, acid, and a variety of proceolytic enzymes, is thermodynamically stable in extracellular conditions, and exhibits a sequence of ompA-tc-met-SLPI.

This invention relates to new purified and isolated mammalian serine protease inhibitor proteins which comprise at least 8 cysteine residues and no more than 107 amino acids. The protease inhibitors are capable of inhibiting chymotrypsin and elastase. Sequences AAC97526 - AAC97534, AAC97574 and AAC97581 and AAC97614 - AAC97631 are encoding the protease inhibitors of the invention, and include oligonucleotide sequences used in the isolation and characterisation of the proteins. Primers AAC97535 - AAC97573 and AAC95582 - AAC97613 are used in the construction of DNA encoding the protease inhibitors. Peptide sequences AAS9358 - AAB33122 respressnt the protease inhibitors of the invention and construction of DNA encoding the protease inhibitors have cytostatic and anti-inflammatory activity. The protease inhibitors have cytostatic and anti-inflammatory activity. Construction, e.g. emphysema, arthritis, glomerulonephritis, protease inhibitor protein is useful for treating a condition, which includes protease mediated tissue destruction, e.g. emphysema, arthritis, glomerulonephritis, puscular dystrophy or tumour invasion. It is also useful for modulating protease activity. The DNAs are useful for producing the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAC97624
```

```
The invention relates to a DNA sequence encoding an analog of a mammalian serine protease inhibitor protein. The analog comprises at least eight expetaine residues and possesses serine protease inhibitor activity, and at least one operational element consisting of a promoter, an operator, a leader sequence, a Shine-Dalgarno sequence, a ribosome binding site or a terminator codon. The DNA is useful in recombinant DNA techniques for directing the production of a serine protease inhibitor protein,

caused by a disturbance in the native protease/protease inhibitor
balance such as emphysema, arthritis, glomerulonephritis, peridontitis,
muscular dystrophy, tumour invasion, sepsis, and caute leukemia. (A)
allows (B) to be recombinantly produced in sufficient quantities and
purities so as to provide economical pharmaceutical compositions. (B) is
resistant to hear, acid, and a variety of proteolytic enzymes, is
thermodynamically stable in extracellular conditions, and exhibits a
high degree of self assembly forming an acive tertiary structure in the
absence of biochemical stimuli. The present sequence represents the DNA
recombinant methods allow manufacture of a class of inhibitors of e.g. cathegin G, elastase, and trypsin, with different specificities. The recombinant serine protease product can be directed to act intracellularly or extracellularly and is useful in treating conditions

XX

New serine procease inhibitors and DNA sequences for treating a procease-mediated condition or tissue destruction e.g. emphysema or tumor invasion and for recombinant production of inhibitors - tumor invasion and for recombinant production of inhibitors - tumor invasion and for recombinant production of inhibitors - procease inhibitors proteins which comprise at least 8 cysteine residues can on more than 107 amino acids. The procease inhibitors proteins which comprise at least 8 cysteine residues and no more than 107 amino acids. The procease inhibitors are capable of inhibiting chymotrypsin and elastase. Sequences AAC97534.

AC975781 and AAC97614 - AAC97614 - AAC97631 represent DNA encoding the procease inhibitors of the invention, and include oligomuclectical procease inhibitors of the procease inhibitors. Peptides are used in the isolation and characterisation of the proteins construction of DNA encoding the procease inhibitors of the procease inhibitors. Peptides used in the isolation of the procease inhibitors. Peptides used in the isolation of the procease inhibitors. Peptides used in the isolation of the procease inhibitors of the procease inhibitors procease inhibitors of the procease inhibitors procease mediated condition, which includes procease mediated condition, procease activity. The DNAs are useful for producing the conservation, e.g. emphysems, arthritis, glomerulonehritis, proteins, especially by recombinant methods.

```
The invention relates to a DNA sequence encoding an analog of a mammalian serine protease inhibitor protein. The analog comprises at least eight eysteine residues and possesses serine protease inhibitor activity, and at least one operational element consisting of a promoter, an operator, a leader sequence, a Shine-Dalgarno sequence, a ribosome binding site or a terminator codon. The DNA is useful in recombinant DNA techniques for directing the production of a serine protease inhibitor protein, e.g. leukocyte elastase or trypsin. The present sequence represents the production of a serine protease inhibitor protein, and sequence coding for ompA-secretory leukocyte protease inhibitor
                                                                                                                                                                                                         New DNA sequences, useful in recombinant DNA techniques for directing the production of a serine protease inhibitor protein, e.g. leukocyte elastase or trypsin -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          269 GATCCGGTTGATACCCCCGACCCGACTCGTCGAAAACCGGGTAAATGCCCGGTAACCTAT 328

subject, comprising administering to the subject an amount of antileukoprotease (ALP) effective to inhibit the activity of elastase or estabepsin G, thereby inhibiting ectopic implantation of endometrial fragments. The present sequence is the coding sequence for human ALP. ALP is also known as secretory leukoprotease inhibitor (SLPI) and alphal-proteinase inhibitor (alphal-PI). ALP plays an important role in the defence of epithelial surfaces against proteolytic damage.
                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method for treating endometriosis in

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used an used for producing a product which can anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical concertucture and/or properties of the agent. M1 can be used in the cospobageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating ductal cancer, infiltrating ductal cancer, infiltrating ductal cancer, continuma, papillary carcinoma and Wilm's tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Carter KC, Ebner R, Endress G, Horrigan S;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; SEQ ID 5016; 44pp; English.

WPI; 2002-106211/14. P-PSDB; AAU11763. Diagnosing inflammatory lung disorders by comparing expression of nucleic acid encoding antiliquor polypeptide in mammal-derived cell population to nucleic acid encoding the polypeptide in reference profile

Claim 8; Page 19; 36pp; English.

The invention relates to diagnosing an inflammatory lung disorder in a mammal, comprising comparing the expression of a nucleic acid encoding or an antileukoprotease polypeptide in mammal-derived cell population, and expression of a nucleic acid encoding the antileukoprotease in (sclosed are a method for identifying a compound that inhibits lung inflammation comprising providing a compound that inhibits lung inflammation comprising providing a cell expression at inthe cell with a test compound and measuring the expression of contacting the cell with a test compound inhibits lung inflammation.

Contacting the cell with a test compound inhibits lung inflammation. The cell where sees in expression of the test compound inhibits lung inflammation.

Also disclosed is assessing prognosis of a mammal with a cancer or a thyroid tumour, comprising measuring the expression of a nucleic acid encoding the antileukoprotease in a mammal-derived cell population of an uncleic acid encoding the antileukoprotease in a cancer reference profile; where a substantial similarity between the expression of the nucleic acid acid sequence in mammal-derived cell population and the cancer or profile; where a substantial similarity between the expression of the nucleic acid sequence in mammal-derived cell population and the cancer or profile; where a substantial similarity between the expression of the nucleic acid sequence in mammal-derived cell population and the cancer or profile; acid sequence in mammal-derived cell population and the cancer or profile; acid sequence in mammal-derived cell population and the cancer or emphysema, asthma, bronchitis, or allergy in a mammal. The compound is cuseful for treating or preventing an inflammatory lung disease in a mammal, an inflammatory disease in a mammal, and is an inflammatory disease in a mammal. antileukoprotease antibody, or antileukoprotease antisense nucleic acid. The methods are useful for assessing the prognosis of a mammal with thyroid carcinoma, ovarian carcinoma or renal cell carcinoma. The present sequence is a cDNA encoding a human antileukoprotease.

New nucleic acid sequences expressed in ovarian, and some other, cancertissues, and derived polypeptides, for treatment of ovarian cancer and identification of therapeutic agents cancer

Claim 3; Page 221; 310pp; German.

This invention describes novel nucleic acid (cDNA) sequences (A) which have anticancer activity and are highly expressed in ovarian tumor tissue anticancer activity and are highly expressed in ovarian tumor tissue (and some also in testis and breast cancer tissue). The products of the invention can be used for gone therapy. (A) are used (i) for cancer tissue). The products of the invention can be used for gone therapy. (A) are used (i) for gones. (B) are used (i) to identify agents suitable for treatment of cancer (ii) directly for treating this form of cancer (including expression from gene therapy vectors) and (iii) for generation of sequence tags) from a particular tissue type before comparison of sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the caper to be revealed, so should reduce the number of failures associated with the fact that BSTS from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of occurrence in a particular tissue. AAZ77450-Z77572 represent the human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAH57161 to AAH57576 represent cell and tissue specific polynucleotide sequences (I). (I) can have cytostatic, immunomodulatory and neuroprotective activities, and can be used in gene therapy. (I) and proteins (II) encoded by then are used in high throughput screening assays to select DNA molecules, RNA molecules, peptide nucleic acids, mimetics, peptides, proteins, agonists, antagonists, antibodies or their fragments, immunoglobulins, inhibitors, drug compounds and pharmaceutical agents. Expression of (I) in a sample indicates the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1.5

Novel fusion protein useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, comprises a first protease inhibitor comprising alpha 1-antitrypsin and a second protease
                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel fusion protein comprising a first protease inhibitor comprising an alphal-antitrypsin or its functionally active portion and a second protease inhibitor or its functionally active protein. The fusion proteins of the invention may act as an inhibitor of protease activity. The fusion protein of the invention such as an inhibitor of protease activity. The fusion protein of the invention such as semphysema, asthma, chronic obstructive pulmonary disease. Cystic fibrosis, ottis media, ottis external or HIV infection, or for treating an individual suffering from or at risk for a disease or disorder involving unwanted protease activity. The proteins are useful for treating demanatological diseases such as actoric demanaticities. eczema

Example 3; Page 89-90; 134pp; English.

40

This invention relates to a novel fusion protein comprising a first protease inhibitor comprising an alphal-antitrypsin or its functionally active portion and a second protease inhibitor or its functionally active protein. The fusion proteins of the invention may act as an inhibitor of protease activity. The fusion protein of the invention inhibitor of protease activity associated with a disorder such as emphysema, asthma, chronic obstructive pulmonary disease, cystic fibrosis, otitis media, otitis external or HIV infection, or for treating an individual suffering from or at risk for a disease or disorder involving unwanted protease activity. The proteins are useful for treating dermacological diseases such as atopic dermatitis, eczema and psoriasis, in inflammatory responses to viral infection, and for treating wounds, sepsis, rheumatorial article periodomical disease, normal measured and activity. tumour metastasis and tumour angiogenesis, gastric ulceration, osteoporosis, Paget's disease, glomerulonephritis, scleroderma, malaria, bacterial infection, Alzheimer's disease, hypertension and muscular dystrophy. The present sequence represents the DNA encoding the rSLAP1 fusion protein of the invention. Sequence 2274 BP; 459 A; 567 C; 602 G; 646 T; 0 other;

The sequence directs synthesis of a preferred secretory leukocyte protease-inhibitor. See also AAN60464, AAN60466-69 and AAP60562-

```
This invention relates to new purified and isolated mammalian serine protease inhibitor proteins which comprise at least 8 cysteine residues and no more than 107 amino acids. The protease inhibitors are capable of inhibiting chymotrypsin and elastase. Sequences AAC97526 - AAC97534, AAC97574 - AAC97581 and AAC97614 - AAC97611 represent DNA encoding the protease inhibitors of the invention, and include oligonucleotide

Perimers AAC97535 - AAC97573 and AAC95582 - AAC97613 are used in the construction of DNA encoding the protease inhibitors. Peptide sequences AAB53102 by Perimers and pacesses inhibitors. Peptide sequences various other peptides used in the isolation of the invention and Yne protease inhibitor of the invention and various other peptides used in the isolation of the protease inhibitors. The protease inhibitors have cytostatic and anti-inflammatory activity. The serine protease inhibitor protein is useful for treating a protease inhibitor protein is useful for treating a destruction, e.g. emphysema, arthritis, glomerulonephritis, periodontitis, muscular dystrophy or tumour invasion. It is also useful consoluting and model and protease activity. The DNAs are useful for producing the

The invention relates to a DNA sequence encoding an analog of a mammalian exerine protease inhibitor protein. The analog comprises at least eight cysteine residues and possesses serine protease inhibitor activity, and at least one operational element consisting of a promoter, an operator, a leader sequence, a Shine-Dalgarno sequence, a ribosome binding site or a terminator codon. The DNA is useful in recombinant DNA techniques for directing the production of a serine protease inhibitor protein, e.g. leukocyte elastase or trypsin. The present sequence represents the DNA that encodes a secretory leukocyte protease inhibitor (SLPI).

                                                                                                                                                                                                           Retroviral infection is inhibited by admin. of an SLPI, or its analogue or deriv. A useful SLPI deriv. is CLPI, a truncated SLPI mol. having only the last 60 amino acids of the native parotid inhibitor. SLPI acts by blocking a host cell enzyme essential for retroviral infection; it is a powerful inhibitor of human leucocyte elastase, cathepain G and human trypsin. The inhibitor provides an effective and relatively safe method for treating HIV infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Secretory leukocyte protease inhibitor; retroviral; infection, HIV; AIDS; SLPI; CLPI; parotid inhibitor; antiviral; anti-HIV; ss.

The present invention describes a method for inhibiting, in vitro, retrovirus infection of CD4+ cells comprising contacting the cells with a secretory leukocyte protease inhibitor (SLPI) having the amino acid sequence of a naturally occurring SLPI or a substitution analogue having 107 amino acid residues. SLPI inhibitos enzymes whose function are necessary for retroviral infection of the cell. SLPI is a potent inhibitor of elastase, trypsin, cathepsin G and chymotrypsin. The method is useful for treating retrovirus infection in a patient and associated diseases such as acquired immunodeficiancy syndrome (AIDS). The present sequence encodes a truncated version of SLPI designated CLPI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; peptidase; cell proliferative disorder; arteriosclerosis; psoriasis; myelofibrosis; cancer; autoimmune disorder; Crohn's disease; inflammatory disorder; AIDS; anaemia; allergy; asthma; atherosclerosis; Grave's disease; multiple sclerosis; scleroderma; infection; diabetes; metabolic disorder; Addison's disease; cystic fibrosis; diagnosis; glycogen storage disease; obesity; therapy; HPEP-9; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              63

```

The invention relates to human secreted polypeptides designated LP095, 2C LP191, LP217, LP220, LP229, LP237 or LP238 and nucleic acid molecules encoding such polypeptides. Novel secreted proteins of Alzheimer's disease, diabetic retinopathy, psoriasis, pancreatitis, arteriosclerosis, rheumatoid arthritis, colorectal adenomas, severe reperfusion injury, neoplasms and cancer especially liver cancer. They be used to generate transgenic animals or knock out animals, which in the development and screening of the invention can current sequence for useful reagents for use in the treatment of diseases associated with The polypeptide associated activity. They are also used in gene therapy. CC The present sequence is human LP229 secreted protein encoding cDNA.

This invention relates to new purified and isolated mammalian serine procease inhibitor proteins which comprise at least 8 cysteine residues and no more than 107 amino acids. The protease inhibitors are capable of inhibiting chymotrypsin and elastase. Sequences AAC97526 - AAC97534 AAC97534 and AAC97614 - AAC97641 represent DNA encoding the sequences inhibitors of the invention, and include oligonuclectide sequences used in the isolation and characterisation of the proteins. Primers AAC97535 - AAC97573 and AAC9582 - AAC97613 are used in the construction of DNA encoding the protease inhibitors. Peptide sequences AAB53028 - AAC97613 are used in the various other peptides used in the isolation of the protease inhibitors. The protease inhibitors and various other peptides used in the isolation of the protease inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 destruction, e.g. emphysema, arthritis, glomerulonephritis, periodontitis, muscular dystrophy or tumour invasion. It is also useful for modulating protease activity. The DNAs are useful for producing the proteins, especially by recombinant methods.

are upregulated in response to induction of p53 activity in human colon cancer EB1 cells. It has a high content of cysteine residues and shares a cysteine motif with antileukoproteinase (ALP) or secretory leukocyte proteinase inhibitor (SLPI). RedS has proteinase inhibitor activity and is involved in p53-mediated growth suppression pathways. They are potential targets of p53 regulatory activity and are useful for modulation of cellular proliferation. PRG5 gene is localised to human chromosome 20q12-13. The PRG target molecules have cytostatic and immonomidatory activity. PRG polynucleotides, proteins and antibodies are useful as diagnostic and therapeutic agents for detection and treatment of cancer and therapeutic agents for detection and treatment of cancer and therapeutic agents for detection and treatment of cancer and therapeutic agents for detection and treatment of cancer and therapeutic agents for detection and treatment of cancer and therapeutic and function downstream of p53, that cannot be activated in the p53-deficient tumour cell. Antibodies can be used as inducers of cell cycle arrest and/or apoptosis. The DNA sequences can be used to generate 'knockout' animals as a model of

Smith RF, Xiang Z; Rizvi SK, Agarwal P, Murdoch PR,

WPI; 2001-570768/64. P-PSDB; AAG67519. Novel isolated secreted polypeptide useful for treating nervous and muscular diseases, gastrointestinal ulceration, coagulation and immune disorders, microbial diseases, inflammation and transplant rejection -

Claim 2; Page 47; 102pp; English.

The present sequence encodes a human secreted polypeptide. The secreted polypeptides and polynucleotides are useful for treating nervous and muscular diseases, for inhibiting tumour formation and netastasis, for treating gastrointeetinal ulceration, for preventing and treating diseases in spinal cord, thyroid gland, ovary, prostate, renal gland, small intestine, heart, trachea, thymus, lymph node, remainstant system and colon, for treating lipase deficiency in cystic fibrosis and pancreatitis, for treating undesirable clot formation such as myocardial infarction, during angioplasty and all surgical procedures that require decreased blood clot formation, for treating increasing on disorders and microbial diseases, for treating inflammation and transplant treating indisorders and microbial diseases, for treating the loss of essential ferroxidases, for suppressing appotosis, and for regulating vascular smooth cell proliferation. They may also be used as vaccines.

```

```
The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 4606 GTTGCAGTGAAGCTGGGCAGCTGCCCAAGAGACCAACTGCGCTGC-----CTCAGCCCC 4659

                                                                                                                                                                                                                           The present invention provides the protein and coding sequences of 973 human testicular antigens, and fragments of their genomic sequences. The sequences can be used in the treatment of cardiovascular, urinary system, reproductive system, immune, respiratory, neurological and gastrointestinal disorders, infections, and particularly cancer, especially testicular cancers. The present sequence is a DNA encoding a protein fragment of the invention.

inflammation or neurodegenerative disorders e.g. Kallmann's and Down's syndromes, Alzheimer's and Huntington's diseases. It may also be used to reduce excess levels of prolactin in the treatment of galactorrhea and hypogonadism, and decrease the amount of free circulating somatostatin to prevent somatostatin's inhibitory effect on the release of growth hormone. The fusion of this protein to His-tag, HA-tag, IgG domains, etc. facilitates protein purification and fusion to IgG-1, IgG-3 and albumin increases the half life time in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a human cDNA clone HKABR62 which encodes serine protease inhibitor (serpin) and is obtained from human keratinocyte tissue cDNA library. The protein obtained from this clone shows a high degree of sequence similarity to Mus musculus secretory leucocyte protease inhibitor. The cDNA and the serpin are used in the diagnosis and treatment of disorders related to abnormal level of the protein or mutation in the nucleotide sequence. The serpin can be used for treating disorders characterised by degradation of extracellular matrix, e.g. cancer, arthritis, multiple sclerosis and immune system disorders, for treating wasting associated with excessive protease production during
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 AlaGlnGluProValLysGlyProValSerThrLysProGlySerCysProIlelleLeu 20

Novel PRO polypeptides and agonists and antagonists of them, used to diagnose and treat cardiovascular, endothelial and angiogenic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to methods for stimulating or inhibiting angiogenesis and cardiovascularization. The methods involve the use of pharmaceutical compositions based on the following proteins, PRO179, PRO238, PRO344, PRO844, PRO846, PRO1760, PRO205, PRO321, PRO317, PRO877, PRO849, PRO882, PRO885 or PRO887. These proteins were identified by isolating cDNA clones encoding secreted proteins. The proteins of the invention may be used to diagnose and treat cardiovascular, endothelial or angiogenic disorders. The present sequence is a cDNA clone encoding one of the proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  J, Baker KP, Ferrara N, Gerber H, Gerritsen ME;

The invention provides membrane-bound PRO polypeptides and polynucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO sequences have homology with proteins including LDL receptors. TIE ligands and various enzymes. The membrane-bound proteins and receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be remployed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, especially
                                                                                                                                                                                                                                                                                                                                                       Gurney AL, Smith V, Watanabe CK;
                                                                                                                                                                                                                                                                                                                                                                                                                                  Membrane-bound proteins and related nucleotide sequences

proteins. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bioactive molecules, such as toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Godowski PJ;

Zhang Z;
                                         RESULT 69
```

```
The invention relates to a method of diagnosing (I) the onset or progression of benign prostatic hyperplasia (BPH), or screening (II) for or identifying an agent that modulates the onset or progression of BPH.
and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO uncleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays.

AAF44270 to AAF44470 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAF44087 to AAF44269 and AAB65154 to AAB65300 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying drugs for and diagnosing benign prostatic hyperplasia, by detecting expression levels of one or more genes in prostate cells from patient that are differentially regulated compared to normal prostate
